

## SETUP

# Where to put your Gemini API key

---

The reasoning runs on **Google Gemini**. You only add your key in one place.

### Option A — edit config.py (simplest)

Open config.py — near the top you'll see:

```
GEMINI_API_KEY = "" # line 7 – paste your key here
GEMINI_MODEL = "gemini-3.5-flash"
```

Paste your key on **line 7**:

```
GEMINI_API_KEY = "AQ.Ab8...your-actual-gemini-key"
```

That is the only change needed.

### Option B — environment variable (edit no files)

```
export GEMINI_API_KEY="AQ.Ab8...your-actual-gemini-key"

# Windows (Command Prompt):
set GEMINI_API_KEY=AQ.Ab8...your-actual-gemini-key
```

### Get a key

Create a free key at Google AI Studio: <https://aistudio.google.com/apikey> (keys start with AQ. or AIza).

### Install the client (once)

```
python -m pip install openai
```

### Run it

```
python -m streamlit run app.py # dashboard
python main.py --all # terminal
```

### Change the model (optional)

Set GEMINI\_MODEL in config.py — e.g. gemini-3.5-flash, gemini-2.5-flash, or gemini-flash-latest.

**Resilient:** if the key is missing or a call fails, the system falls back to deterministic rules, so a run never breaks.
